

Screebl Lite has been cranking along for quite some time now. From coming in 5th in its category in ADC2 to the hundreds-of-thousands of times that the app has been downloaded, it's been really fun watching this innovative little utility spread throughout the Android community.

We often get the question "why should I upgrade to Screebl Pro?". We think that there are lots of great reasons, including supporting continued enhancement and bug fixes.

In a nutshell, you get the following Pro-only features:

- o **Locale/Tasker Integration** - Include Screebl detection capabilities as you configure your phone. Your imagination is the limit!

- o **Screen Timeout Control** - You are in control of how fast your screen times out after your phone is moved out of a configured Screebl range.

o **Icon Customization** - Choose how you want your icons to look in the notification bar.

o **Improved Detection Algorithm** - Bed reading, lying on your right side, and other tricky detection scenarios work better in Screebl Pro. You have move control over Axis Variance, the key parameter that makes these work.

Here's a detailed description of the enhanced features that you will get ONLY in Screebl Pro...

Much of the major new functionality in Screebl Pro is centered around its integration with [Local e](#). In case you've never heard of Locale, it is a system that allows you to customize the behavior of your phone based on any one of a number of different "conditions" such as your location, the time of day, etc. Imagine having your phone automatically mute the ringer whenever you are in court, or turning on WiFi when you are at home.
